The NetWorker Solution

NetWorker Backup Terms

Schedule

Is a NetWorker resource that **specifies the level** of client backup to perform on any given day. It does NOT specify the time to perform a backup – it is given by the group resource.

Backup device

Network-based Backup Protection

Efficient Backups

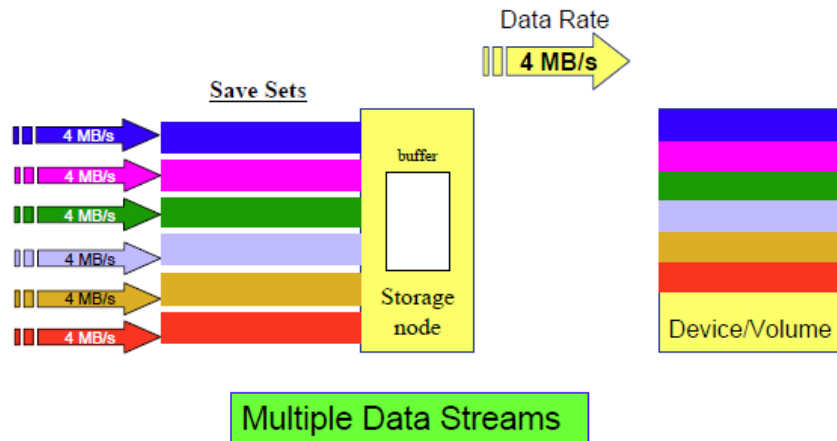

NetWorker supports:

- Multiple concurrent backups
- Backups from different operating systems
- Backups to multiple devices

Backup with and without Multiplexing and OTF

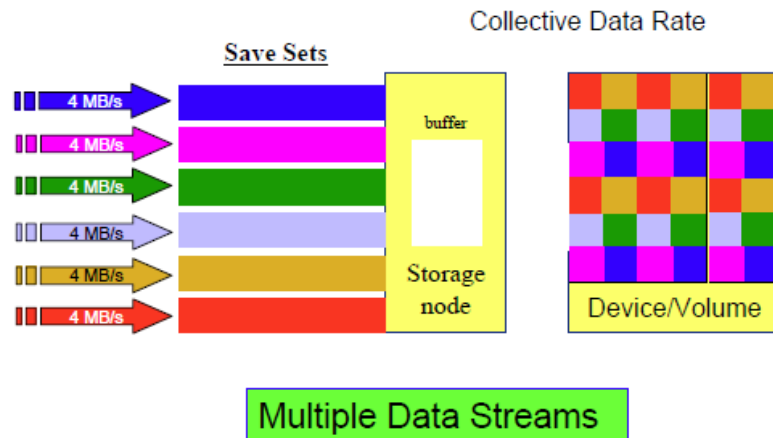

Backups Without Multiplexing

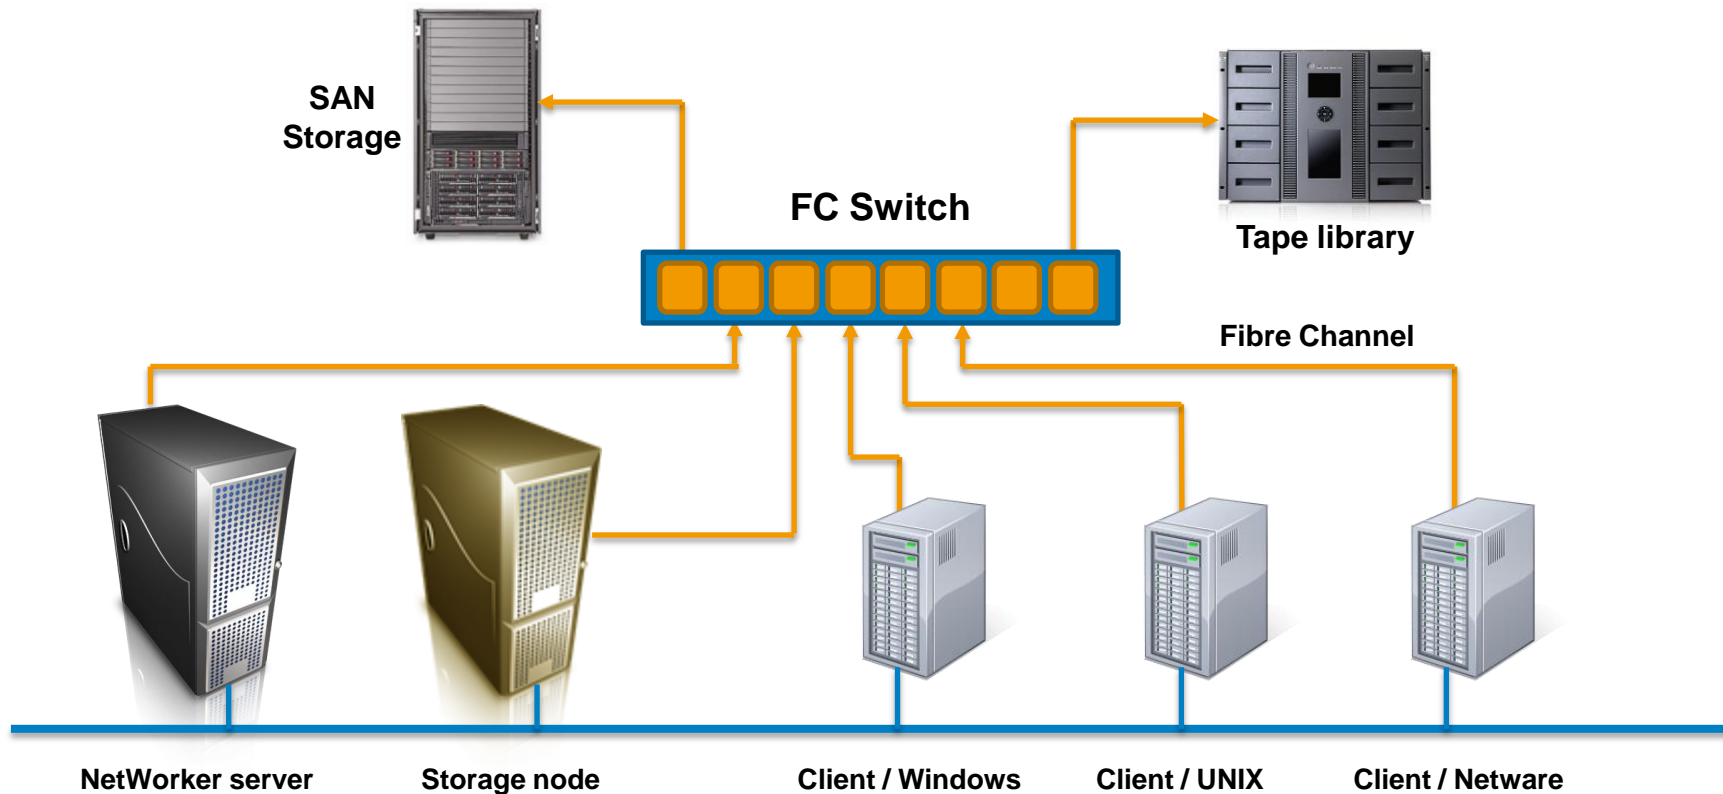

Without multiplexing, only one stream is written onto a device at a time

NetWorker Uses Open Tape Format - or **OTF**, is a data format that allows multiplexed, heterogeneous data to reside on the same tape.

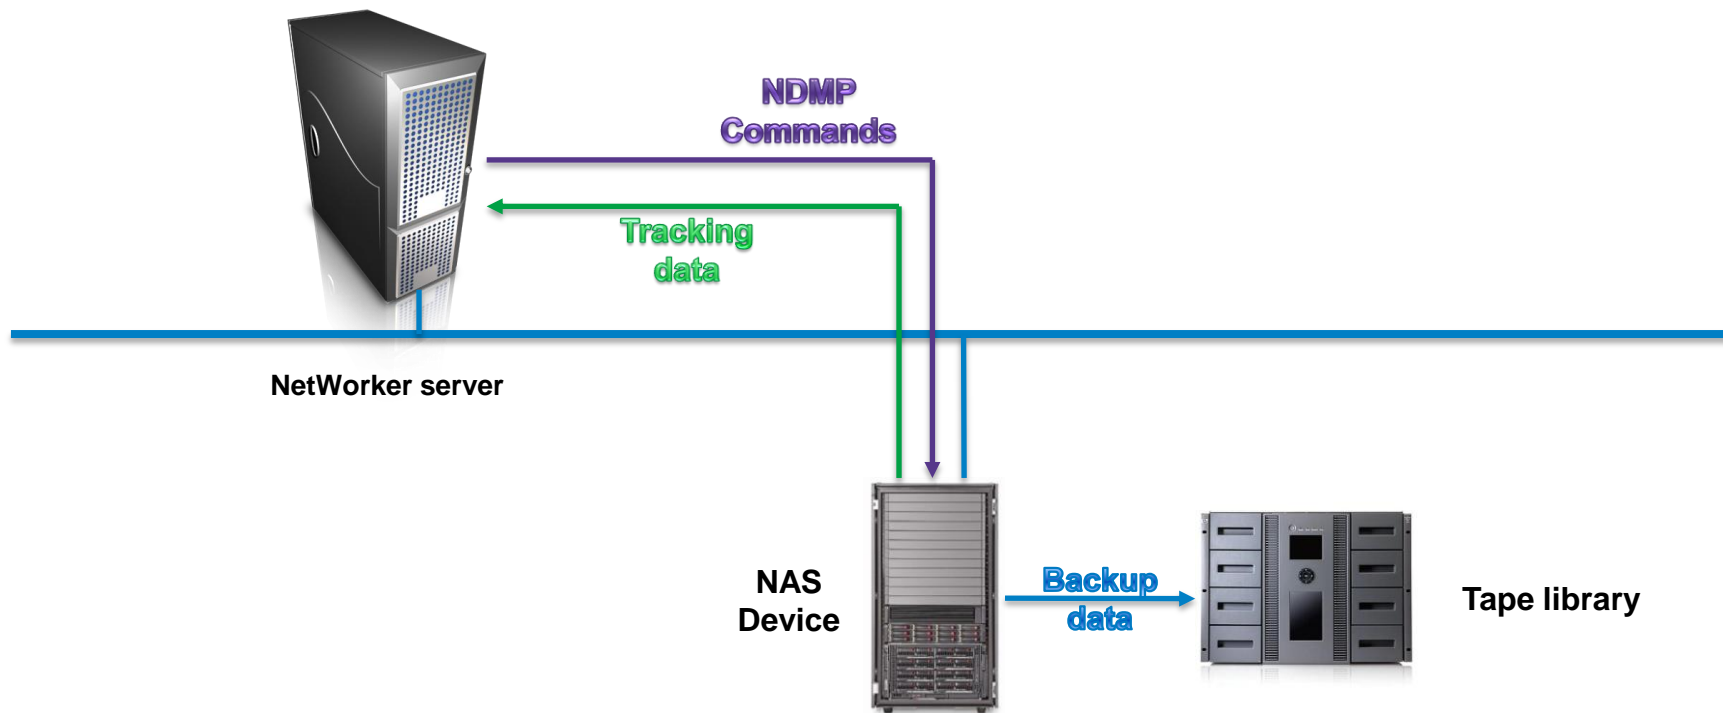

NetWorker Uses Multiplexing

NetWorker in a SAN Environment

NetWorker and NDMP

NetWorker with De-duplication

NetWorker server

- Identifies and backs up only unique sub-file data objects
- Redundant data identified at the source
- De-duplication support provided through integration with EMC Avamar

Configured for de-duplication backup of save sets

Stores de-duplicated client data

De-duplication Node

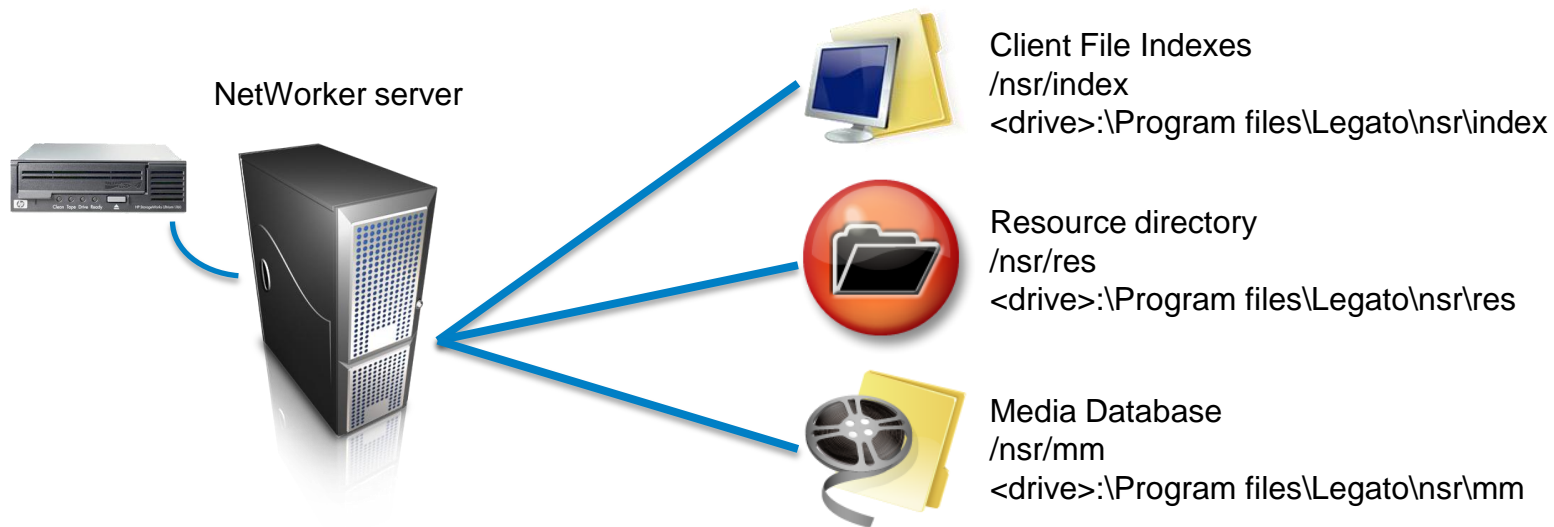

De-duplication Client

Storage Node

Stores de-duplication backup metadata

NetWorker Control Data

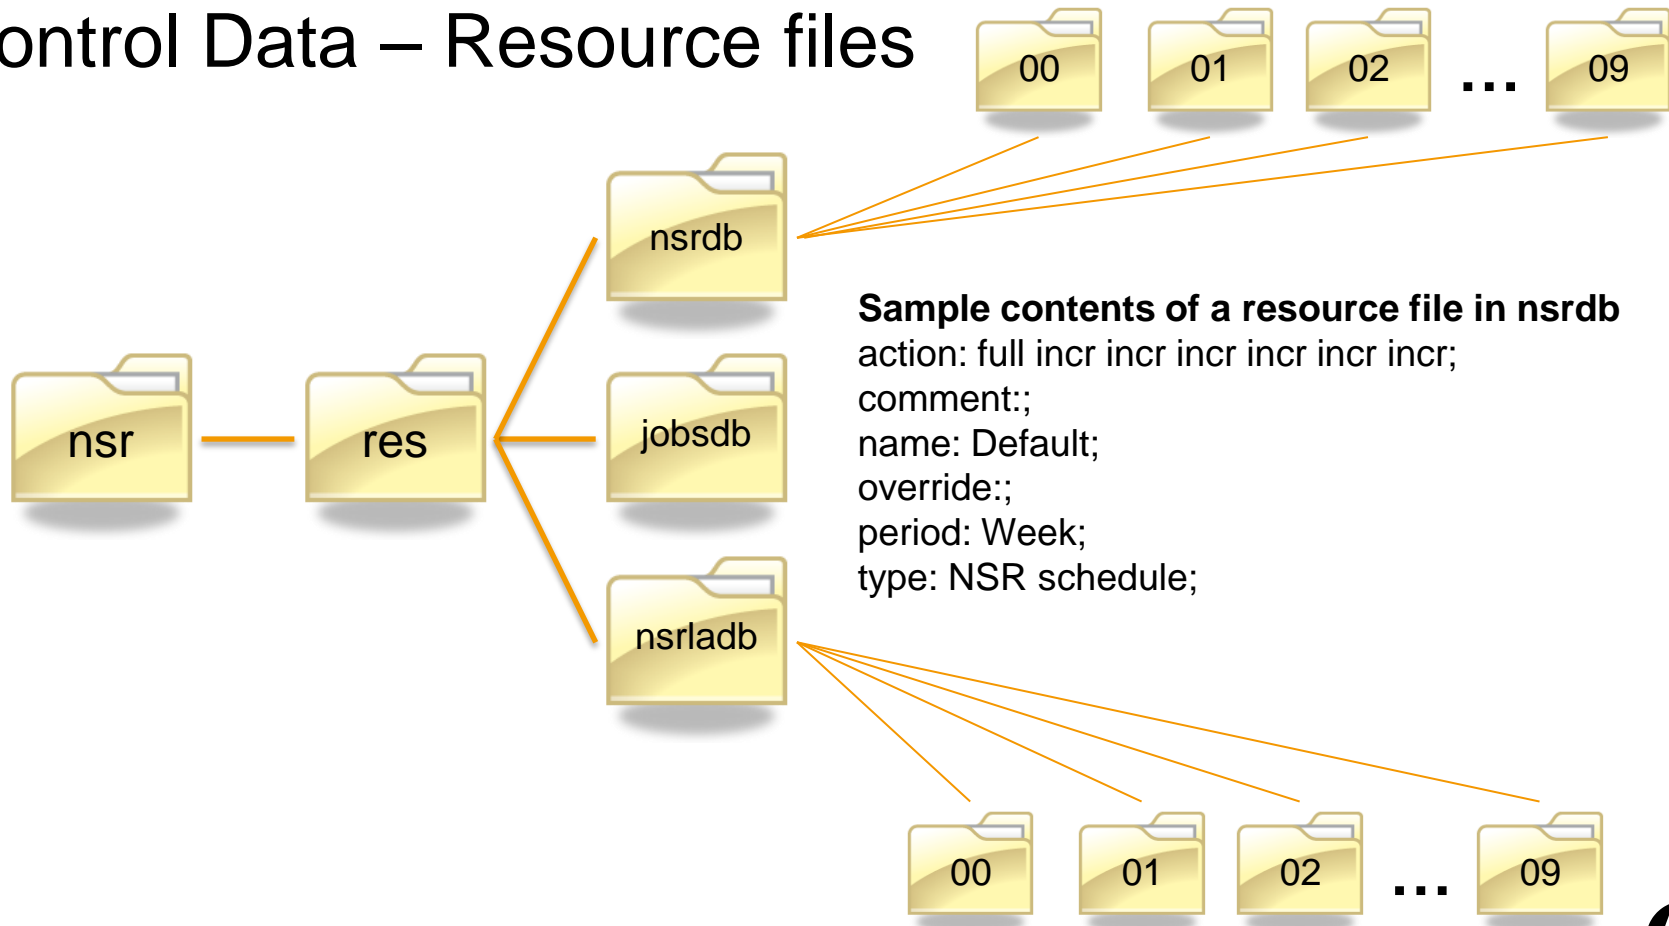

Resource Directory: This directory (the resource database) contains the resource files.

Media Database: This database is used to track all volumes used by NetWorker and all save sets written to those volumes.

Client File Indexes (CFI): These databases track each file (pathname) backed up by clients, allowing users to browse their backups for files from a particular point in time. The NetWorker server creates and maintains one CFI per physical client.

Control Data – Resource files

NetWorker Resources

Resource Type	Function
NSR client	Configure supported clients for backup/recovery.
NSR device	Configure backup devices.
NSR directive	Configure optional directions clients are to follow for backup.
NSR group	Configure start time for scheduled backups. Group clients together.
NSR jukebox	Configure media library/autochanger/jukebox.
NSR label	Configure pool (volume) label templates.
NSR license	Enable (license) a NetWorker product or feature.
NSR notification	Configure actions to be taken when NetWorker events occur.
NSR policy	Configure lengths of time. Used to set aging values for backups and volumes.
NSR pool	Configure characteristics for matching a save set to a set of volumes.
NSR schedule	Set the level (Full, incremental, ...) for backups based on day of week or month.
NSR stage	Configure management of save sets stored on file type (disk backup) volumes.
NSR storage node	Configure a remote storage node to be scanned for tape devices.
NSR usergroup	Configure user access privileges.
NSR	Configure the NetWorker server's attributes.

NetWorker Backup Levels

Level	Description
Full	Back up all files regardless of whether they have changed.
Level 1–9 (differential)	Back up all files that have changed since the most recent lower level backup.
Incremental	Back up files that have changed since the last backup, regardless of what level it was.
Skip	Do not perform a backup today.
Consolidated	Perform a level 1 backup and then merge it with the most recent Full backup.

Consolidated Backups

Client-initiated Backup

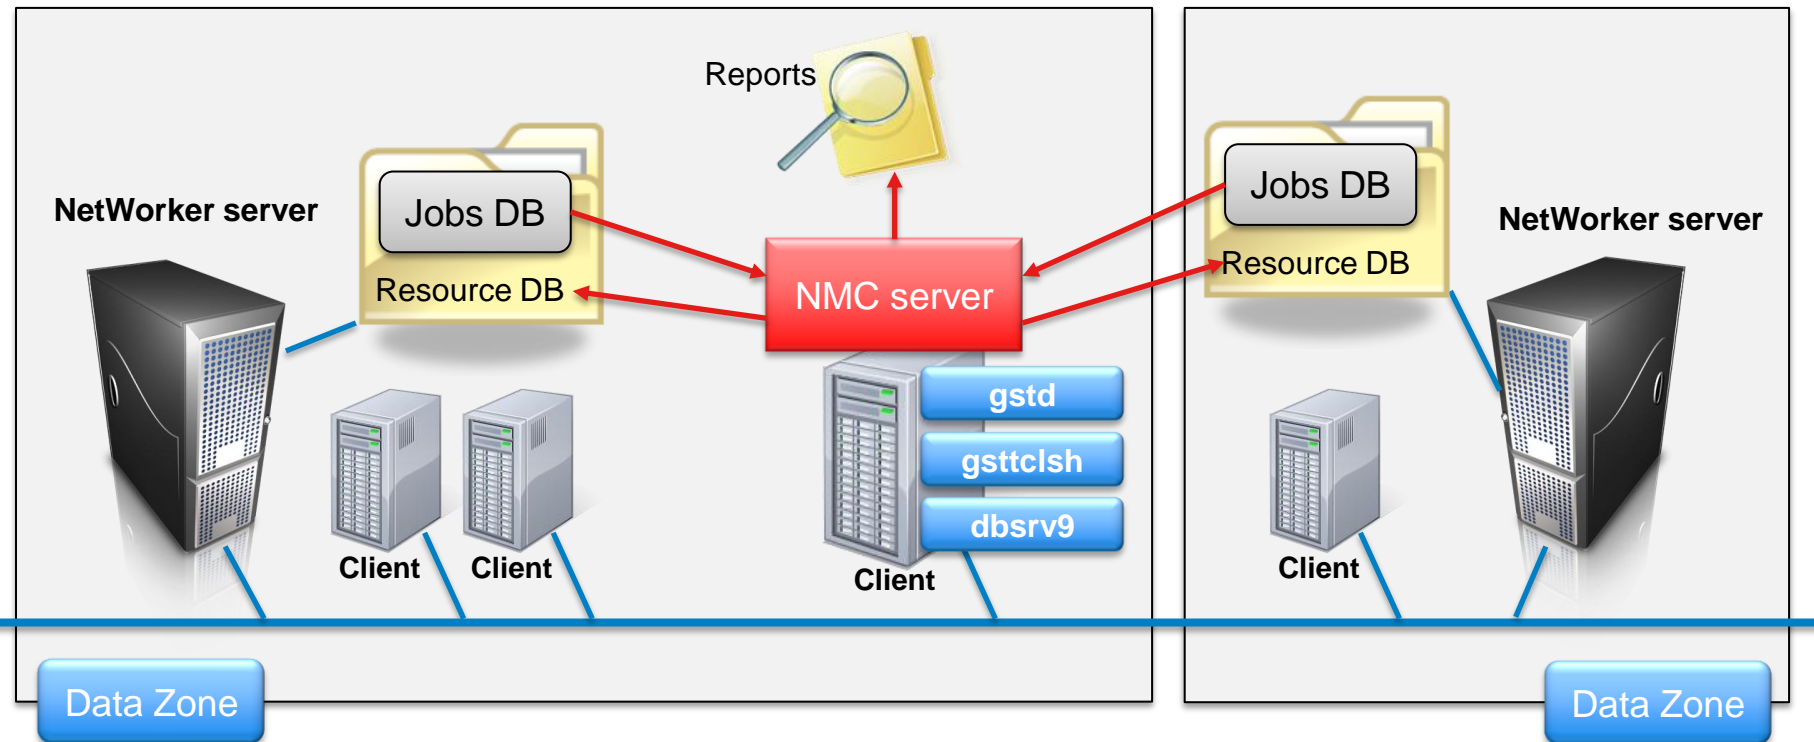

Server-initiated Backup

Server-initiated Backup using savegrp

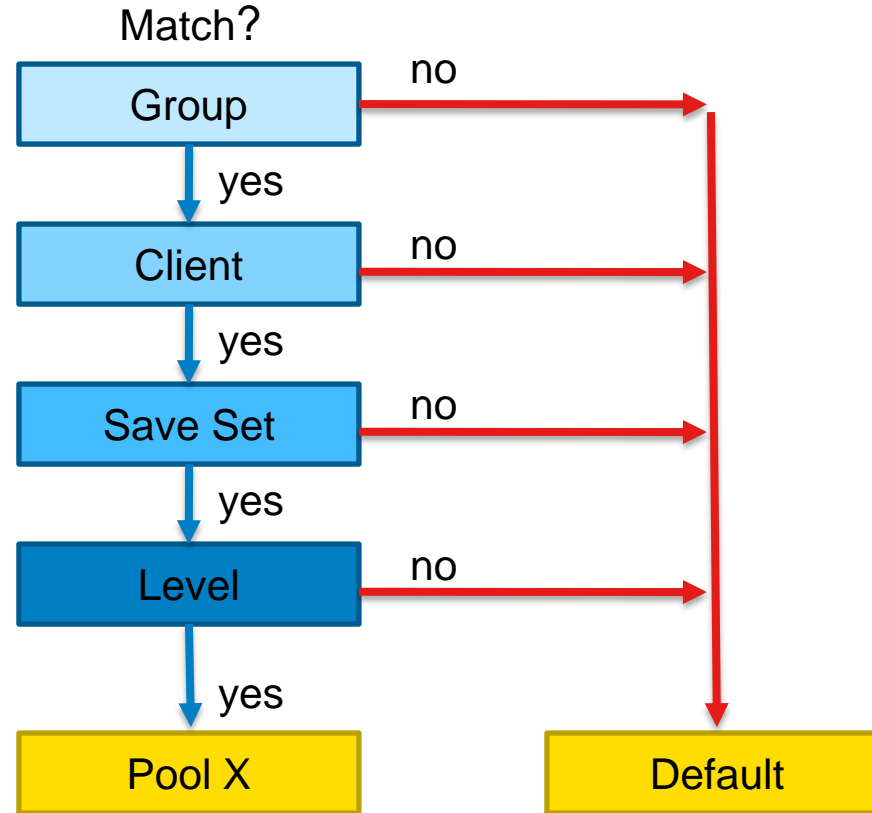

NetWorker Management Console (NMC) Server

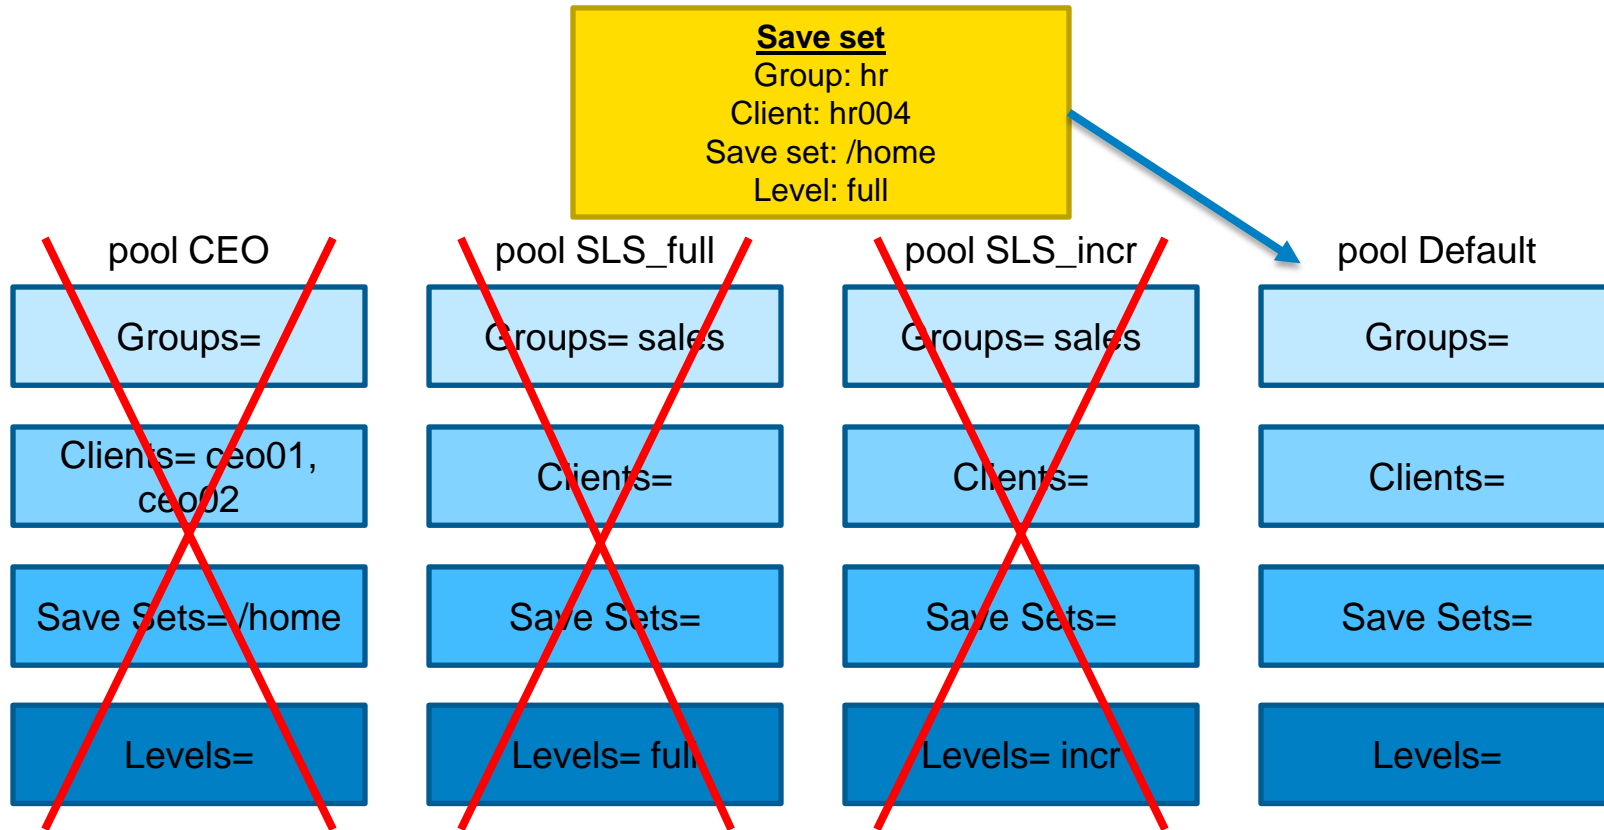

Provides a Java interface for configuration and management of NetWorker server(s), Server Node(s), Client (s).
Can gather information about backups from multiple data zones. Can generate detailed, customizable reports

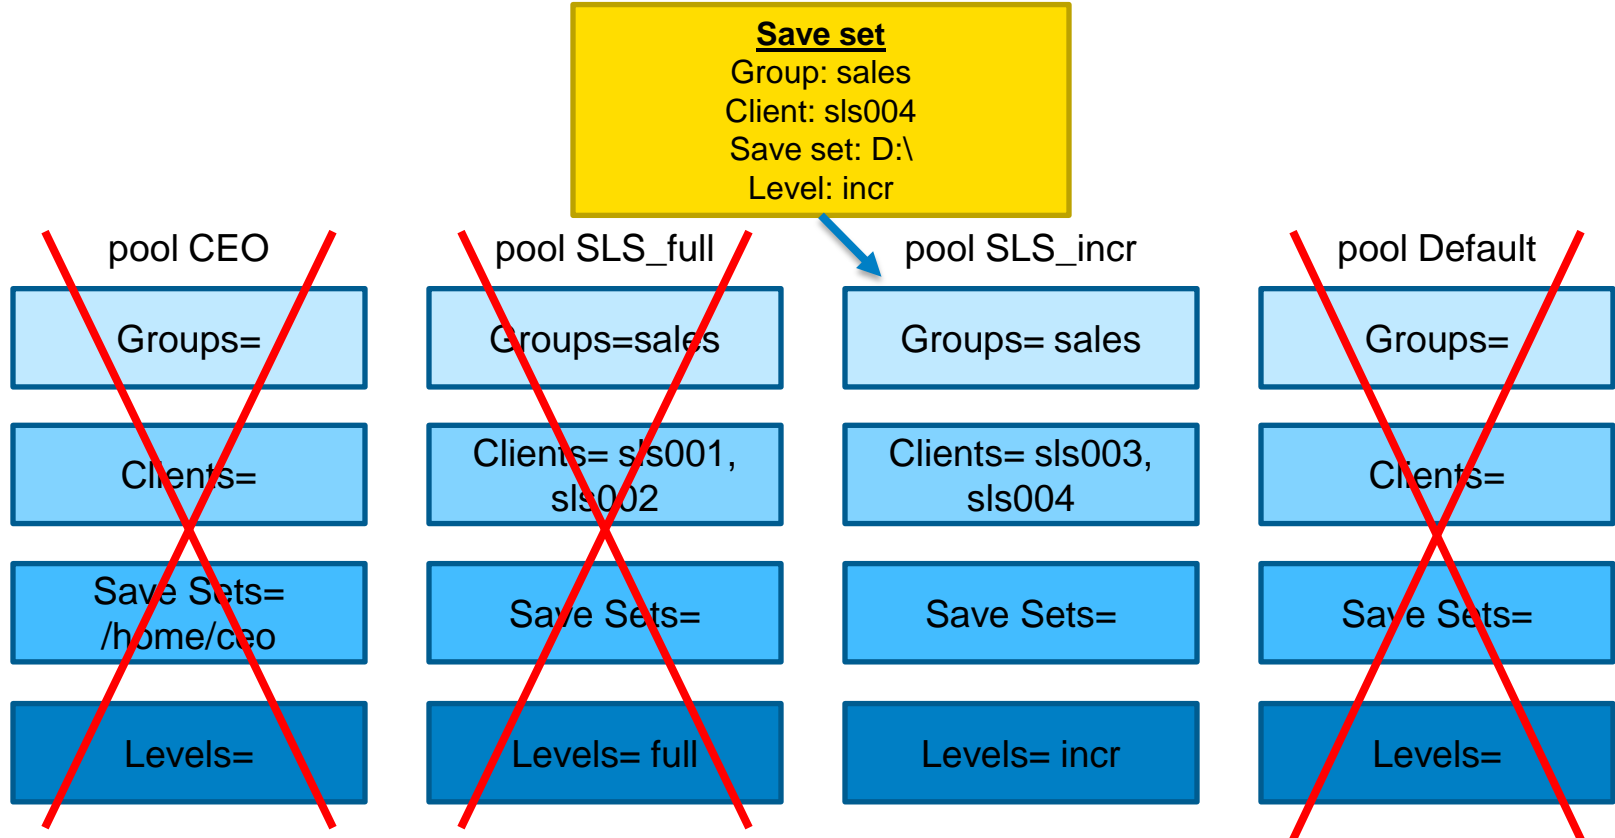

Pool Selection Criteria

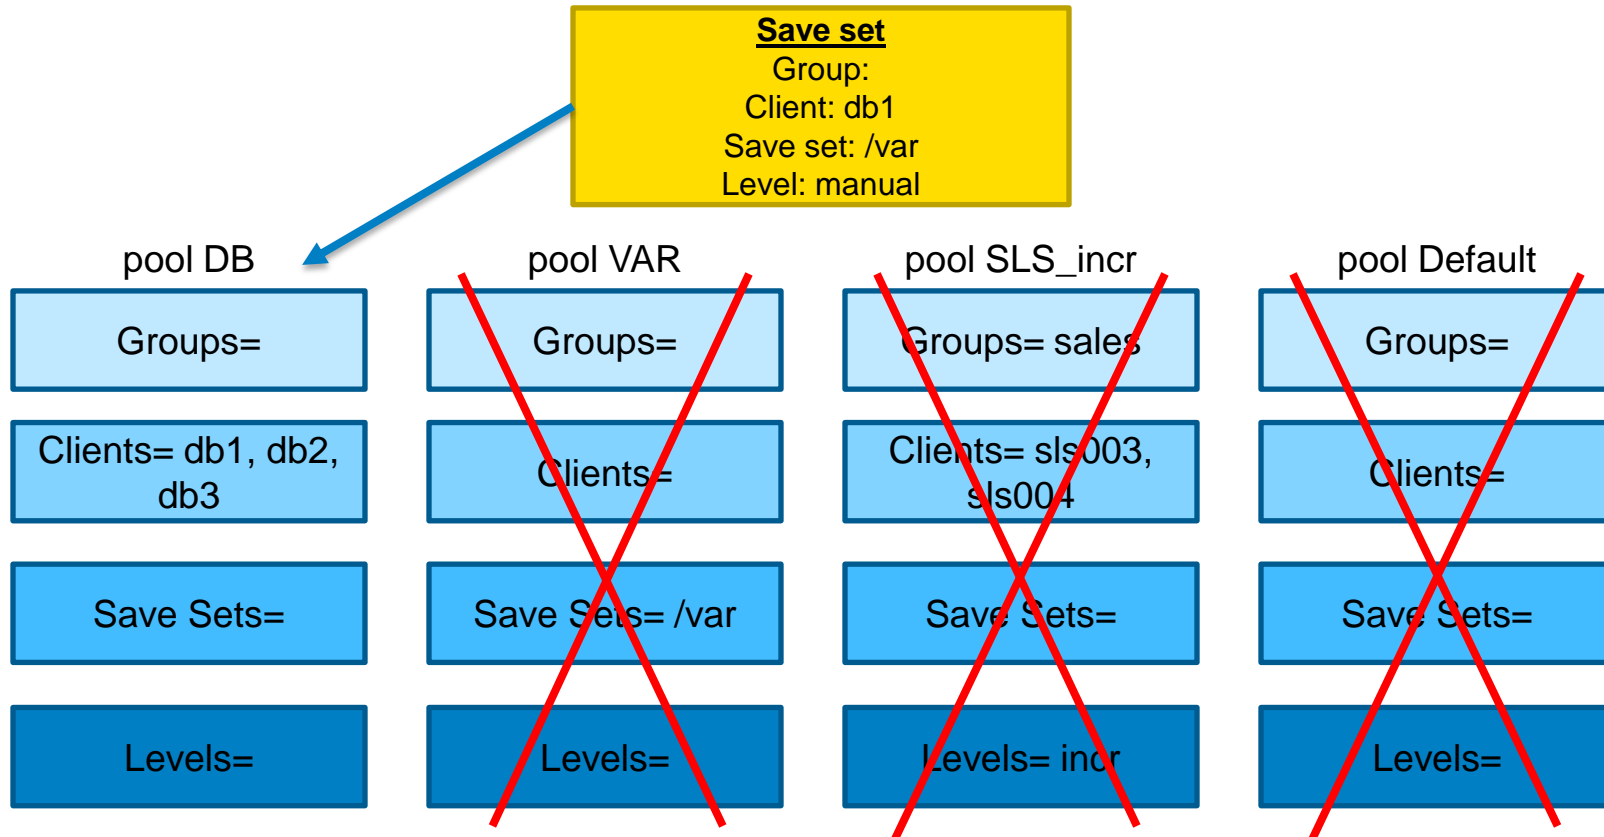

Pool Selection Criteria

Pool Selection Criteria

Pool Selection Criteria

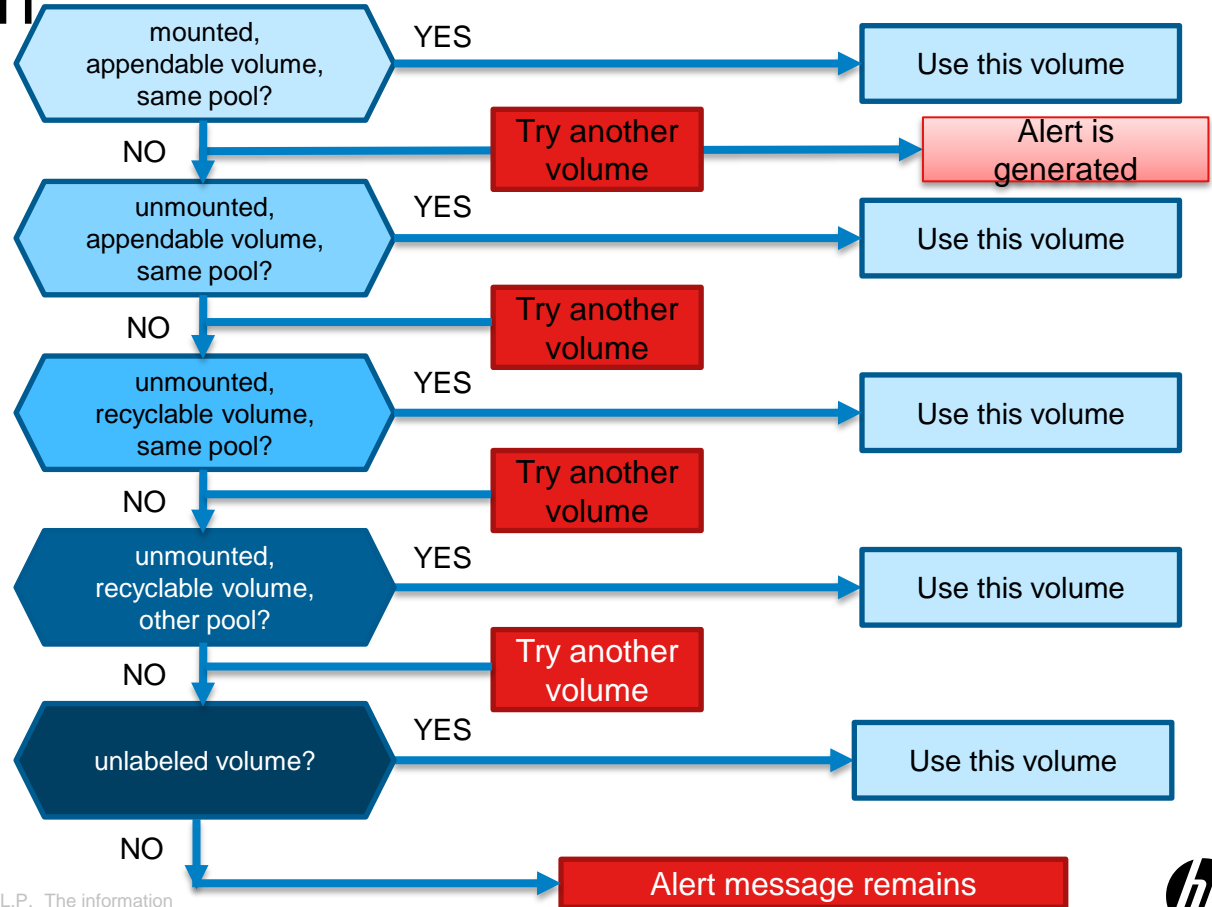

Pool Resource Attributes

Attribute	Function
Pool Type	The pool type (Backup or Backup Clone)
Label Template	The label template to use for the pool.
Groups	Groups allowed to send data to the pool.
Clients	Clients allowed to send data to the pool.
Save sets	Save sets which may be written to the pool.
Levels	Levels of backups which may be written to the pool.
Devices	Devices on which volumes in the pool may be mounted. (By default, no devices are selected. This actually behaves the same as when all devices are selected.) Selecting one or more devices results in the pool always using only those devices.
Max parallelism	Specifies the maximum number of simultaneous save streams that can be sent to a device on which a volume from this pool is mounted.
Auto media verify	Specifies whether to reread data when a device is closed after a save and compare Auto media verify it to the data written to the volume. (disabled by default)
Recycle to other pools	Allows recyclable volumes in the pool to be relabeled into a different pool, if necessary. (disabled by default)
Recycle from other pools	Allows recyclable volumes from other pools to be relabeled into this pool, if necessary. (disabled by default)
Store index entries	Specifies whether to generate CFI entries for save sets written to the pool.
Retention policy	A volume normally becomes recyclable when all save sets on the volume are recyclable. This attribute can specify a longer period of time before a volume becomes recyclable.

Volume Selection

Client Roles in a Recovery

Source Client

Destination Client

Administering Client

Client Role	Description
Source client	This is the NetWorker client from which the data being recovered was originally backed up.
Destination client	This is the NetWorker client to which data is being recovered. If different from the source client, it must be listed in the source client's Remote access list.
Administering client	This is the NetWorker client from which the recovery is being performed. If different from the source client, it must be listed in the source client's Remote access list.

Recovery Types

Type of Recovery	Performed By	Performed on which host	Save Set Status	Databases Used	Method of Recovery
Browsable	Any user	Any client	Browsable	CFI & MediaDB	nwrecover (UNIX) NetWorker User (Windows) recover CLI
Save Set	System Administrator	Any client	Browsable Recoverable Recyclable	MediaDB	nwrecover (UNIX) NetWorker User (Windows) recover CLI
Directed	(Windows - NetWorker Administrator) (UNIX – root only)	Any client except destination client	Browsable	CFI & MediaDB	NetWorker User (Windows) recover CLI (Windows & UNIX)
NW Server (Disaster)	System Administrator	NetWorker server	N/A	N/A	mmrecov (bootstrap) nsrck -L7 (CFI)

Browsable Recovery

- User selects the set of files and directories to be recovered
- Operating system permissions are adhered to
- “Point-in-time” recovery is performed
- Useful when many files have been deleted or renamed since full backup

Save Set Recovery

- Useful for recovering non-browsable save sets
- By default, an entire save set is recovered. However, you can recover individual files and directories.
- May be faster than a browsable recovery

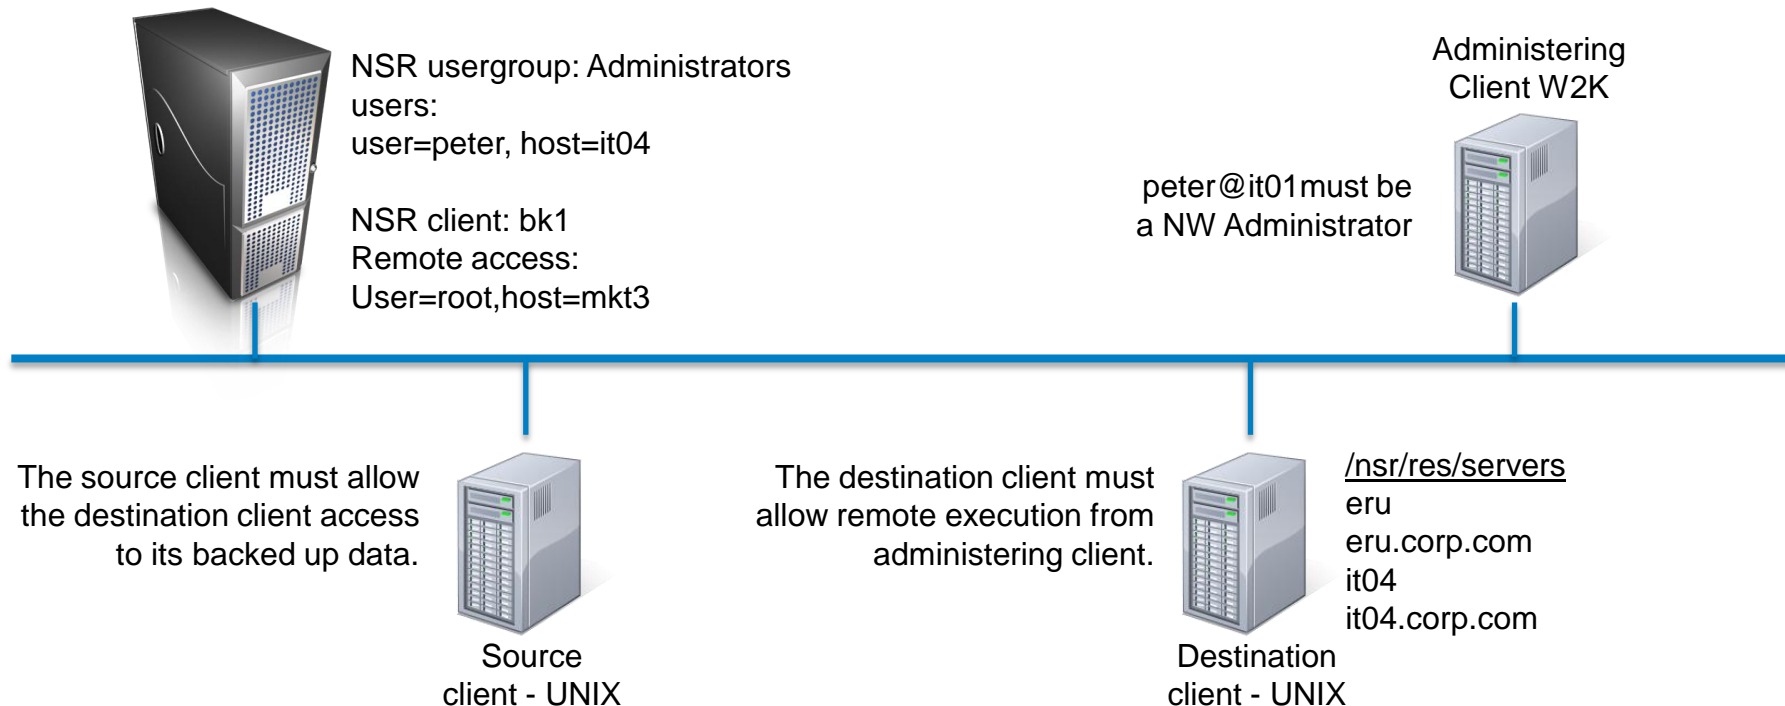

Save Set Recovery

A directed recovery is useful when:

- You are not able to log in to the destination client
- You want to perform all recoveries from a single NetWorker client

Directed Recovery – Required Privileges

Disaster Recovery – rebuild NetWorker server

Prerequisites for Recovering a NetWorker Server

- ✓ A bootstrap save set must have been backed up
- ✓ The bootstrap report should be available
- ✓ Client file index save sets should have been backed up

~~base~~

NetWorker Interfaces

- NW Management Console
- Nsradmin
- Nsrwatch

The screenshot displays the NetWorker Management Console (NWMC) interface on the left and a Windows command prompt terminal on the right.

NetWorker Management Console (NWMC): The interface shows a list of servers on the left pane. The main pane displays the output of the `nsradmin> help` command, listing legal commands and their syntax.

Terminal Window: The terminal shows the output of the `nsradmin> help` command, displaying the status of the server `leg_sun1` and the results of the `nsradmin> help` command.

Legal commands are:

- `bind [query]`
- `create attrlist`
- `delete [query]`
- `edit [query]`
- `help [command]`
- `print [query] <server>`
- `server [name]`
- `show [attrlist]`
- `types`
- `update attrlist`
- `quit`
- `visual [query]`
- `option [list]`
- `[list]`
- `unset [query]`
- `?` [command]

Where:

- `query ::= attrlist`
- `attrlist ::= attrlist`
- `attribute ::= name`

nsradmin> _

Terminal Output:

```
Server: leg_sun1          Wed Oct 12 17:24:23 2005

Up since: Mon Oct  3 17:19:52 2005          Version: NetWorker 7.3.Build.84 Eval
